

Product Design — Session 1 Feedback

Prompt: Design a product to help people start exercising again (Meta)

Overall Score: 5.8 / 10

Your self-assessment: segment felt too broad, pain point felt too big/untight

01 PERFORMANCE OVERVIEW

You ran a clean, well-signposted process — clarifying questions, goal framing, segmentation, pain points, and solutions all showed up in the right order. The two weak links are exactly what you flagged yourself: the segment ("people on Meta for similar hobbies") stayed broad enough to cover hikers, board-gamers, and athletes alike, and the chosen pain point ("don't trust the group") was named but never narrowed to a specific moment of failure. The session ran out of time before metrics or guardrails were discussed.

WHAT'S WORKING

- Explicit 3-criteria framework (population, alignment, usage) to score segments
- Used a named persona (Alice) to ground pain points in a real scenario
- Checked in with interviewer 3 times before moving sections
- Tied the opportunity back to Meta's community mission early

NEEDS IMPROVEMENT

- Segment definition too broad — spans multiple distinct sub-groups
- Chosen pain point ("trust") is stated, not narrowed to a specific trigger moment
- No success metrics or guardrails reached before time ran out
- First pain point dismissed as "too personal" without testing if Meta could still influence it

02 DEEP DIVE

User Segmentation

4/10

WHAT YOU SAID

"those on the Meta platform to look for people with similar hobbies... so they can join groups on Meta, like hiking groups or board game groups."

HOW TO MAKE IT STRONGER

This segment spans hikers, gamers, and athletes — groups with very different trust dynamics and exercise needs. The 3-criteria scoring (population/alignment/usage) was a nice framework, but applied to a segment that's really 3-4 segments stacked together. Split it before scoring: "new-to-city adults using Meta to find in-person fitness groups" is tight enough to design against.

Try: I'll narrow this to one sub-group: people using Meta groups specifically to find recurring fitness activities, since that's where exercise and Meta's community goal overlap most directly.

Pain Point Selection

5/10

WHAT YOU SAID

"they don't trust the group... is there any alternative? I would say there are alternative... I wouldn't say there are a lot of alternative here. So alternative here is low."

HOW TO MAKE IT STRONGER

"Trust" was scored but never broken into a specific failure moment. Trust could mean: not knowing if the group will actually show up, not knowing if it's a safe physical space, or not knowing if skill levels match. Each implies a different solution. Naming the exact moment trust breaks down would have made the next step (solutioning) sharper and faster.

Try: The specific trust gap is: a new member can't tell, from a profile alone, whether this group will actually follow through on showing up consistently.

03 FEEDBACK PROGRESS TRACKER

This is Session 1 — no prior sessions exist yet. These scores are your baseline.

Tighten user segments

Baseline — Session 1

Segment chosen covers multiple distinct sub-groups instead of one

Narrow pain points to a specific moment

Baseline — Session 1

Pain point named at a high level but not broken into a concrete failure case

Reach metrics before time runs out

Baseline — Session 1

Did not get to success metrics or guardrails in this session

Use explicit prioritization framework

Baseline — Session 1

3-criteria scoring (population/alignment/usage) was clear and consistently applied

- Session_1_Feedback.pdf (this report — baseline)

04 LEARNING PLAN

YOUR #1 FOCUS

Narrow segments to a single, specific group before scoring them

Why this matters:

Your prioritization framework (population/alignment/usage) is genuinely solid — but it's only as useful as the segment you feed it. A segment broad enough to include hikers, gamers, and athletes can't be scored meaningfully on one set of criteria, which is exactly what made the pain-point step feel "too big" afterward, as you noticed yourself. Fixing this one step tightens everything downstream.

Practice suggestions:

- Before scoring any segment, ask: "could I name one specific person here?" If not, split it.
- Practice converting one broad segment from a past mock into 3 narrow ones in under 60 seconds.
- When a pain point feels "big," ask what the exact moment of failure looks like for one user.

Effort: Low-Medium | Impact: High | Potential gain: +1.5–2.0 points next session
